– Prospects of
future growth**

Data and analytics is the principal driving force of modern organisations as it is an engine that drives rapid and smarter decision making. The growing emergence of Gen AI is expected to create major disruptions in business and delivery models.

In the present context of technology led growth economy, newer players or older players in newer avatars are gaining significance. Start-ups have become a buzz word in the transition and globally and nationally they are considered as important value creator in economic and business landscape. In the acceleration of start-up phase, investors are considered to be the pillar of support for the ecosystem not just as fund providers but also as mentors. Existing entrepreneurs are also gearing up on their agility in the new business landscape. Intrapreneurs are also a major force behind new age business bringing their experience and expertise to create, lead and accelerate businesses.

India is well positioned to leverage the global digital and communication revolution. India's technology industry has emerged as a vibrant force propelling the nation's GDP, employment opportunities, and overall economic growth. India is now the third largest start-up destination in the world with accelerated growth especially after post pandemic. The rise in internet users, expected to reach 900 million by 2025 from 759 million in 2022, primarily from rural areas, is also propelling the technology industry's growth. There are over 99,000 DPIIT-recognised start-ups in India as of 31 May 2023, and this continues to attract investor interest globally.
